

# Genetic Programming

# Genetic Programming

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- Two different view of what GP means:
- Content view:
  - Automatic Programming
  - Creation of programs by artificial evolution
  - Different representations
- Representation view:
  - anything using tree representation
  - May be programs, may be other things

# Representing Programs in EC

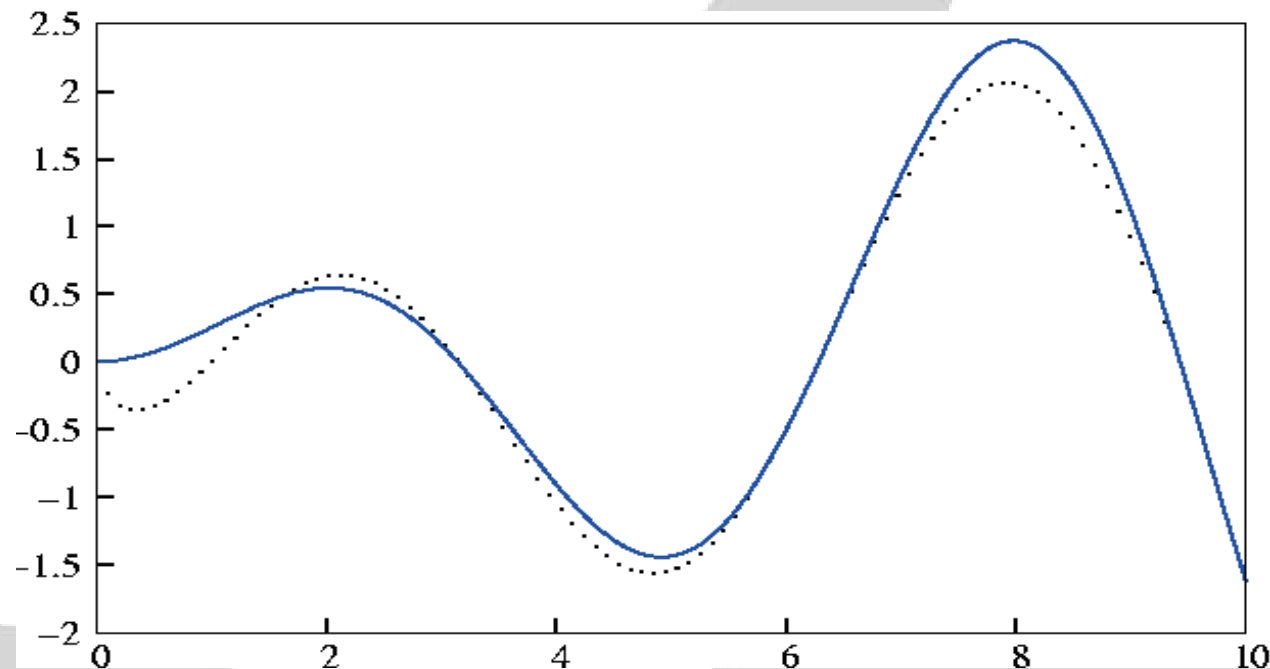

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- Tree representation
  - LISP-like expression
  - Local data storage
  - Tree Genotypes
  - Tree genetic operators
  - Stack for data storage
- Linear representation
  - Series of instructions
  - Registers for data storage
- Graph representation
  - Nodes contain instructions
  - Edges control program flow
  - Stack for data storage

# Example Problem: Symbolic Regression

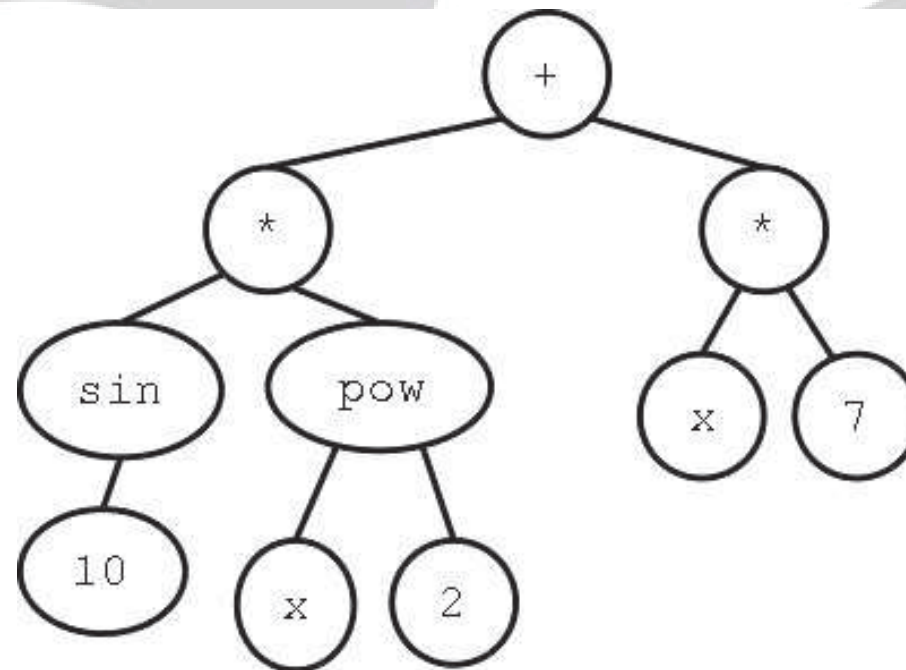

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- Given: a set of function points
- Problem: find a function that fits the points as closely as possible
- Common problem in stats, process engineering, ...

# Tree Representation for Symbolic Regression

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- Function Set and Terminal Set

# The Terminal Set

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- Anything with arity 0 and one output
  - Arity: number of inputs (unary, binary, ...)
- Inputs
  - Sensors
  - Function variables
- Constants
  - Numbers

**Do we need to supply all possible constants?**

# The Function Set

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- n-ary functions
  - E.g. mathematical functions +, -, \*, /, log, sum, ...
  - E.g. boolean functions and, or, not, xor, ...
  - E.g. memory functions store, read
  - E.g. control structures if..then..else, for, ...
  - E.g. side-effect functions move, pen up, turn, ...

# The Function Set

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- n-ary functions
  - E.g. mathematical functions +, -, \*, /, log, sum, ...
  - E.g. boolean functions and, or, not, xor, ...
  - E.g. memory functions store, read
  - E.g. control structures if..then..else, for, ...
  - E.g. side-effect functions move, pen up, turn, ...
- Sufficiency
  - need a set of functions sufficiently complex for the task
  - but not too rich

# The Function Set

[www.cercia.ac.uk](http://www.cercia.ac.uk)

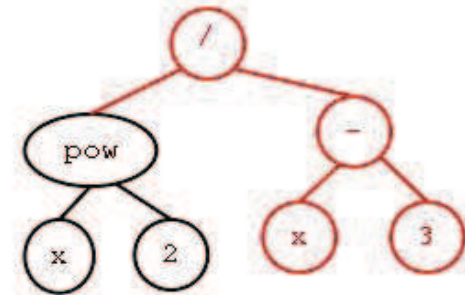

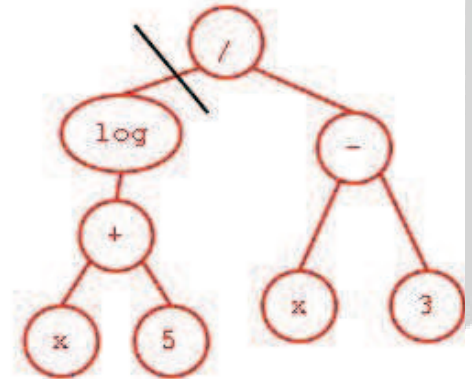

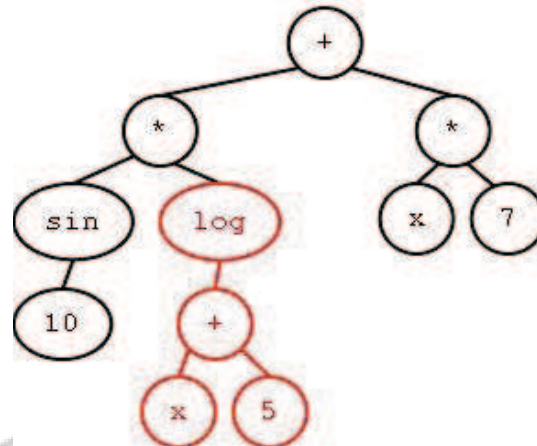

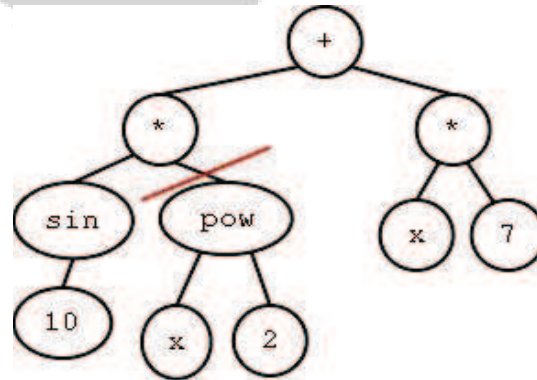

- n-ary functions
  - E.g. mathematical functions +, -, \*, /, log, sum, ...
  - E.g. boolean functions and, or, not, xor, ...
  - E.g. memory functions store, read
  - E.g. control structures if..then..else, for, ...
  - E.g. side-effect functions move, pen up, turn, ...
- Sufficiency
  - need a set of functions sufficiently complex for the task
  - but not too rich
- Coverage
  - Functions need to be defined over all inputs
  - E.g. division needs to be defined for input 0

# Crossover

[www.cercia.ac.uk](http://www.cercia.ac.uk)

## • Branch Swap

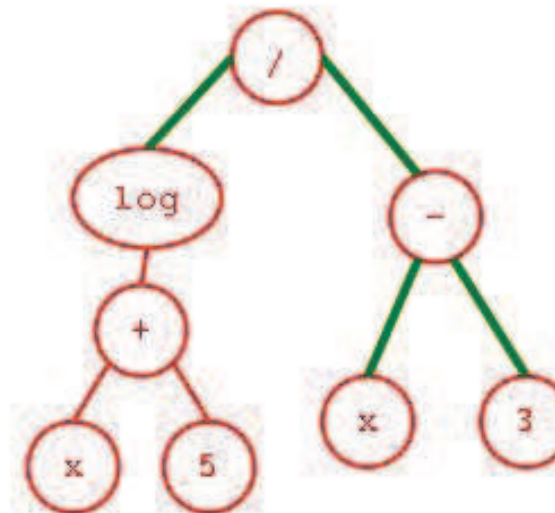

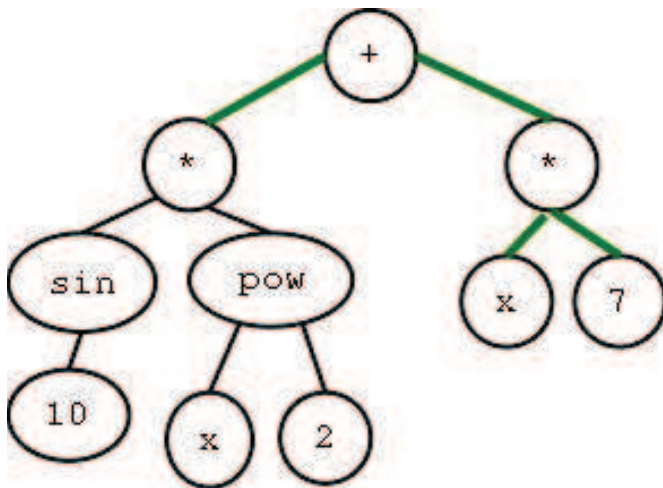

- Pick random branch at each parent
- Swap branches

# Matched 1-point Tree Crossover

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- From root follow branches
- As long as nodes have same arity
- Same crossover point for both parents, within matched branches
- n-point crossover possible, too

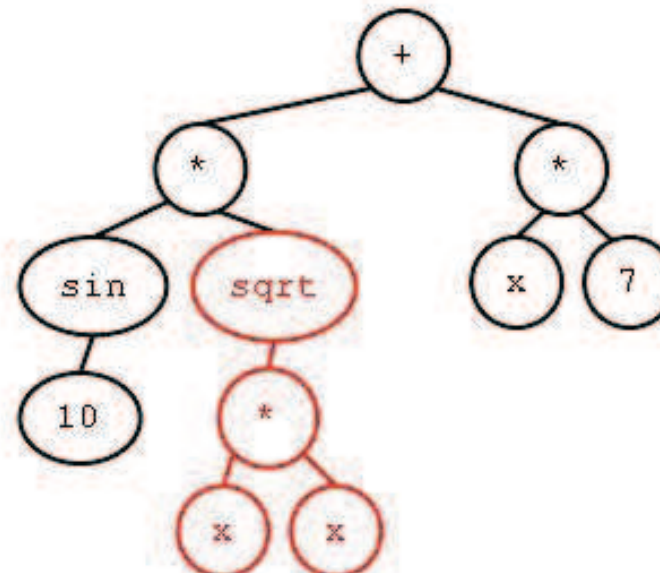

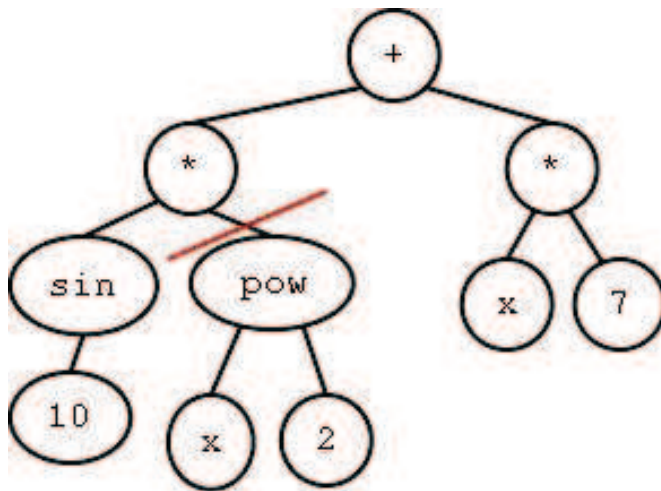

# Mutation

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- Branch replacement
  - Pick random branch from parent
  - Delete branch
  - Replace with random new branch
  - (New branch created as in initial population creation)

# Creation of Initial Population (1)

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- Full Method
  - with fixed tree depth `treeDepth`:
  - 1. do add random function nodes until all branches have  $(\text{treeDepth} - 1)$  depth
  - 2. add random terminal nodes to all branches

# Creation of Initial Population (2)

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- Growth Method
  - with fixed maximum tree depth `maxDepth`:
  - 1. do add random function or terminal nodes until all branches have terminals or are  $(\text{maxDepth} - 1)$  depth
  - 2. add random terminal nodes to all branches without terminals

# Creation of Initial Population (3)

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- Ramped half-and-half
  - with fixed maximum tree depth  $\text{maxDepth}$  and population size  $\text{popSize}$ :
  - for  $n=2..\text{maxDepth}$  create:
    - $(\text{popSize}/2 * (\text{maxDepth} - 1))$  individuals using growth with  $\text{maxDepth}=n$
    - $(\text{popSize}/2 * (\text{maxDepth} - 1))$  individuals using full with  $\text{treeDepth}=n$

# Bloat

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- Program size grows
  - As a result of uneven crossover
  - Unused code
  - Slows down runs
  - More space, cpu time required
  - Mutation, crossover of unused code - offspring behaviour is identical
- Countermeasures
  - Incorporate program size into fitness
  - Use special crossover (e.g. matched one-point crossover)

# Linear Representation Genetic Programming

[www.cercia.ac.uk](http://www.cercia.ac.uk)

## Register Machine

- Van-Neuman Architecture
- String of instructions and data
- Functions get arguments from registers
- String Representation
- Usually variable-length
- Crossover: variable-length versions of one-point, two-point
- Mutation: 'usual' random gene replacement, but also add, delete operations

```
R1 = R2 + 3
```

```
R3 = R3 + 1
```

```
if(R2 > 0)  
  jump 2
```

```
R2 = R3 + R1
```

```
R1 = sqrt (r2)
```

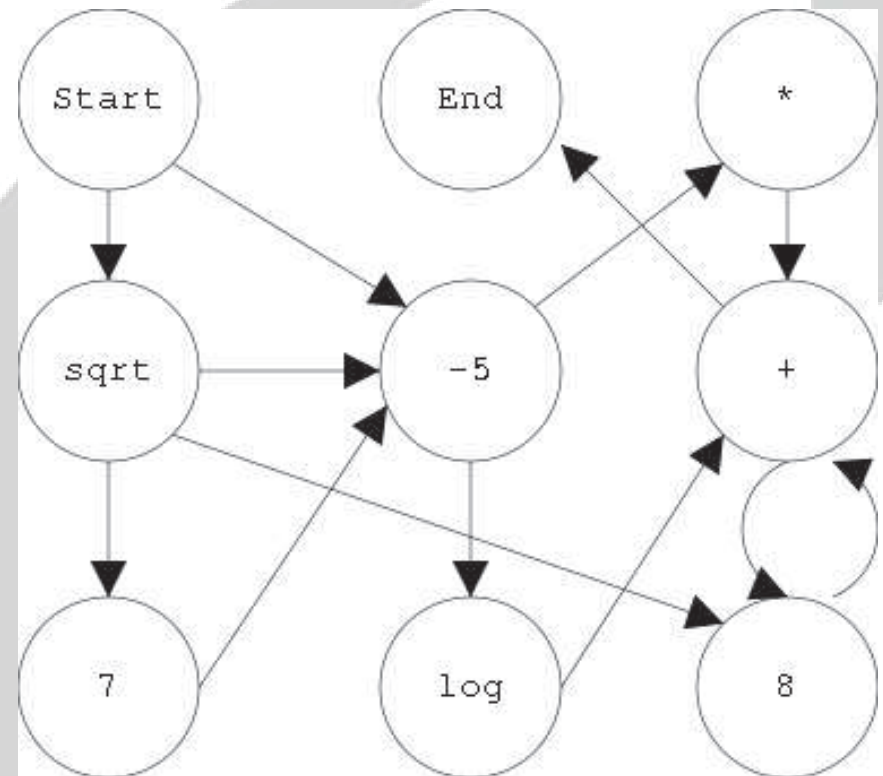

```
...
```

# Graph Representation Genetic Programming

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- Nodes define operations
  - Operands come from stack
  - Result will be put onto the stack
  - Edges define control flow
  - Control mechanism controls which edge to follow
  - E.g. depends on value written to stack {<0, =0, >0}
  - Loops and recursion common
  - Specialized Crossover and Mutation operators

# Genetic Programming == Automatic Programming?

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- Does it start from a high level specification ?
- Does it produce an executable program ?
- Does it automatically determine the number of steps a program should take ?
- Does it produce results that are competitive with human programmers, engineers, mathematicians and designers ?

# Genetic Programming Applications

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- Regression
  - Chemistry, Engineering
  - Statistics
  - Classification etc.
  - Data Mining
  - Intrusion Detection
  - Image classification
- Control
  - Plants
  - Robots
  - Spacecraft altitude manoeuvres
  - Animation
- Design
  - Neural Networks
  - Electronic Circuits

# Summary

[www.cercia.ac.uk](http://www.cercia.ac.uk)

- Automatic Generation of Programs
  - within limits...
- Tree Representation
  - Tree crossover
  - Branch replacement mutation
- Other Representations
  - Linear
  - Graph
